

Gearing
Gearing methods compared

Introduction to the work book

The data is recorded on a separate worksheet for each boat type and sorted by Male/Female (M/W) and listed in alphabetical order, except 1x is in finish order. In addition to the recorded data there are 10 columns of derived data and many percentages and averages which have highlighted data entry errors as well as some interesting comparisons.

1. For all crew boats the average rig is calculated and then a separate "Analysis" sheet summarises the data for each boat class and calculates 2 types of gearing and is sorted to finish order.
2. The "Analysis" sheets also contain the race results data from which boat velocity is calculated and a table counting the makers, types and shapes of the boats riggers, oars and spoons.
3. The "Makers and Types" sheet consolidates this latter for all classes and calculates market share percentages.
4. The "Class Comparison" sheet compares the classes with each other calculating percentages to highlight differences. These are illustrated in the "Comparison Graphs" sheet.
5. The "Measurement" worksheet shows data on numbers of boats and seats measured.
6. The "Gearing" sheet compares the gearing between classes using FISA and Pin gearing. It includes graphs.

Data recorded

- 1) General Information
 - a) Date of recording
 - b) Boat ID. The majority of boats had no identifying number apart from their country code
 - c) Full/Partial survey. A survey is partial when not all data was collected for the boat and oars. This was usually because the oars were not found but occasionally through forgetting to record all the data.
 - d) Boat type / event. Male or Female and boat type e.g. W4x
 - e) Sweep / scull. This item confirmed / duplicated information in d)
 - f) Country. The three letter country code
- 2) Manufacturer's information
 - a) Boat Make. The following three letter codes were used to identify the boat makes: Emp, Fil, Swi, Kwi, Hud, Win, Flu, Sch, Ves, Syk for Empacher, Filippi, Swift, Kiwi (KIRS Ltd), Hudson, Wintech, Fluid Design, Schellenbacher, Vespoli, Sykes.
 - b) Rigger Make. This was almost always the same as the boat maker or assumed to be if not labelled. The only alternative found was Card Douglas (CD)
 - c) Rigger type. This was recorded as material used and shape. Material was either CF for Carbon Fibre or Al for Aluminium and shape was W for Wing and/or number of stays e.g. CF W is carbon fibre Wing, CF W1 is Carbon Fibre Wing one backstay, Al 3 is Aluminium two stay. A few boats had the wing set on the bow end of the cockpit so they are recorded as e.g. CF W(bow)
 - d) Blade make: the following three letter codes were used to identify the blade maker: C2, Dre, Cro, Emp, and Bra for Concept2, Dreher, Croker, Empacher, and Braca.
 - e) Blade shape: the manufacturers codes or other were used to record blade shape so
 - i) C2: BB for Big Blade, S2 for Smoothie2 and F2S for Fat2 Smoothie. Vortex Edge was recorder separately as V to distinguish between S2 and S2 V which are different shapes and BB and BBV which are the same shape. F2S always has a vortex edge.
 - ii) Dre: Apex, ApexR, BB;
 - iii) Cro: Sli for Slick, Cle for Cleaver, DSn for Droop snoot
 - iv) Emp: BB for Big Blade, Sm for Smoothie
 - v) Bra: BB for Big Blade, W for Wing Blade

No Macon shapes were found.

The following were recorded to the nearest millimetre or tenth of a degree for each seat in the boat. Although measuring to nearest millimetre the accuracy of some measures like line of work to heels, depth of heels, oar length will be less due to the measuring system of tapes and setsquares or the nature of the surfaces being measured – see point 5 below for estimated accuracy of each of the measures.

- 1) Span and Arc position
 - a) Span for all sculling boats
 - b) Spread for all sweep boats
 - c) Distance through the work of the front of the seat when set at front stops
 - d) Line of work to the heels
 - e) Line of work to toes
 - f) Foot stretcher angle to nearest tenth of a degree using a digital pitch gauge.
- 2) Relative height data
 - a) Height of swivel above seat starboard
 - b) Height of swivel above seat port
 - c) Seat below saxboard
 - d) Heel below saxboard
- 3) Splay of feet
 - a) Distance between heels
 - b) Distance between toes
 - c) Shoe length

Only one boat had adjustable splay shoes
- 4) Oar Data
 - a) Overall length of oar
 - b) Oar outboard length
 - c) Oar inboard length
 - d) Blade length from collar to tip
 - e) Blade height measured at maximum width
- 5) Estimated accuracy of the measures
 - a) Span +/- 1.5mm
 - b) Spread +/- 1.5mm
 - c) Distance through work +/- 5mm
 - d) Line of work heels +/- 10mm
 - e) Line of work toes +/- 7mm
 - f) Foot stretcher angle +/- 0.2 degrees
 - g) Swivel above seat +/- 2mm both sides
 - h) Seat below sax +/- 2mm
 - i) Heel below sax +/- 5mm
 - j) Heel distance cm +/- 5mm
 - k) Toe distance cm +/- 5mm
 - l) Shoe length cm +/- 5mm
 - m) Overall oar length +/- 3mm
 - n) Outboard +/- 3mm
 - o) Inboard +/- 3mm
 - p) Blade length +/- 3mm
 - q) Blade height +/- 3mm

Derived data

Brown font is used for all derived data which is as follows

1. Seat to heels – horizontal. Line of work to heels minus Distance through the work
2. Seat to toes – horizontal .Line of work to toes minus Distance through the work.
3. Seat above heels – vertical. Heels below saxboard minus seat below saxboard.
4. Seat above ball of foot. This assumes that the shoes fit the athlete and the ball of foot is two thirds of the shoe length from the heel. This is calculated using the foot stretcher angle and the foot splay angle – hence the complicated formula (can someone check please?)
5. Foot splay angle. This is calculated from the shoes length as hypotenuse and the difference between the distances between the heels and toes of the shoes as the opposite.
6. Handle overlap. This is the usual measure for sculls held horizontal at the orthogonal and for sweep it shows how much the oar handle crosses the boat centre line.
7. Sill height difference L/R. This indicates whether the rig in sculling allows for Left hand over/ overlapping/behind right. In sweep it is less meaningful but it measures whether the average of starboard side sills is higher than the portside sills.
8. FISA Gearing. This is the gearing measure designed by Carl Adam and used in the majority of rigging guides. It is nominally the outboard divided by the spread in sweep (or half the span in sculling). This survey uses the definition from the 2006 survey which is (outboard -2)/ spread for sweep and (outboard -2) / (half span) for scull. The -2 allows for the distance of the pin from the collar because the face of the swivel is about 4 cm wide.
9. Pin Gearing. This is the gearing measure normally used in biomechanical analyses. Its assumes the oar is a first order lever with the fulcrum at the pin and forces are applied at the centre of the handle and the centre of the spoon, the gearing being the outboard divided by the inboard. For scull the inboard is defined as measured inboard less 6 cm to middle of handle plus 2 cm as the centre of the pin is 2 cm beyond the collar. The outboard is measured outboard minus 2 cm and minus half the blade length. For sweep the formula is the same except that it is inboard less 15 cm, assuming that the centre of force is between the two hands 15 cm from the end of the handle.
10. Boat velocity. This is calculated from the race times divided by 2000 m.
